Code Lines for Image Handling

https://gemini.google.com/app/5f9d971367cb1826

User prompt: give me the lines pertaining to images

Response: The lines pertaining to image loading, rendering, and layout in `FINAL PROJECT DRAFT.py` are:

- **Importing Drafter's `Image` component (Lines 32–33)**

```
import drafter as _drafter              # optional layout / image / styling helpers
Image = getattr(_drafter, "Image", None)
```

- **Image directory and helper functions (Lines 199–226)**

```
# ---------------------------------------------------------------------------
# Card images and the table layout
# ---------------------------------------------------------------------------
# The images live in an "images" folder next to this file (create them with
# make_card_images.py).  images/cards/AS.png = ace of spades, TH.png = ten of hearts, ...
IMAGE_DIR = "images"
SUIT_LETTER = {"♠": "S", "♥": "H", "♦": "D", "♣": "C"}
...
def card_file(card: str) -> str:
    return IMAGE_DIR + "/cards/" + card[0] + SUIT_LETTER[card[1]] + ".png"

def card_image(card: str, width: int = 62):
    """A picture of the card (plain colored text if images are unavailable)."""
    if Image is None:
        return card_piece(card)
    return Image(card_file(card), width=width)

def back_image(width: int = 62):
    return Image(IMAGE_DIR + "/back.png", width=width) if Image is not None else "[??]"

def empty_image(width: int = 62):
    return Image(IMAGE_DIR + "/empty.png", width=width) if Image is not None else "[  ]"

def badge_image(kind: str, width: int = 30):
    """kind is 'dealer', 'small_blind' or 'big_blind'."""
    return Image(IMAGE_DIR + "/badges/" + kind + ".png", width=width) if Image is not None else None
```

- **Assembling card rows with face, back, and empty slot images (Lines 252–262)**

```
def card_row(cards: List[str], width: int = 62, hidden: bool = False, slots: int = 0) -> list:
    """Components for a row of cards: faces, or card backs when hidden."""
    row = []
    for c in cards:
        if row:
            row.append(" ")
        row.append(back_image(width) if hidden else card_image(c, width))
    for _ in range(slots - len(cards)):
        if row:
            row.append(" ")
        row.append(empty_image(width))
    return row
```

- **Displaying role badge images and hole card rows in a player's seat (Lines 280–320)**

```
def seat_box(state: State, i: int, reveal: bool = False):
    """One player's seat: name, role badges, chips, bet, status and cards (as images)."""
    ...
    items = []
```

```
        for role in seat_roles(state, i):
            badge = badge_image(role)
            if badge is not None:
                items.append(badge)
                items.append(" ")
        ...
        if p.hole_cards and not p.is_folded:
            mucked = reveal and i == 0 and won == 0 and state.auto_muck
            face_up = (i == 0 and not mucked) or (reveal and i != 0)
            items.extend(card_row(p.hole_cards, 62, hidden=not face_up))
```

- **Displaying community card images on the table and winning hand images at showdown (Lines 346 and 814)**

```
  # Inside table_layout():
  middle = card_row(state.community_cards, 70, slots=5)

  # Inside showdown_page():
  content.append(box(card_row(state.winning_cards, 62), bg=FELT, pad="8px", align="center"))
  ```[cite: 1]
```

---

*User prompt: right now images are not actually being displayed, how can I fix that*

Response: There are three common reasons Drafter won't display images with your current setup: **missing local image files**, **relative path mismatches**, or **an older Drafter version falling back to text**.

Follow these steps in order to diagnose and fix the issue:

### 1. Generate or Verify Your Image Folder

Your code looks for an `images` folder right next to `FINAL PROJECT DRAFT.py`, and specifically expects `back.png`, `empty.png`, a `cards/` subfolder (`AS.png`, `TH.png`, etc.), and a `badges/` subfolder (`dealer.png`, `small_blind.png`, `big_blind.png`).

- Notice your own comment on line 201: `# (create them with make_card_images.py)`. If you haven't run `make_card_images.py` yet, or if the `images/` folder isn't in the exact same directory where you launch Python, the browser will show broken image icons.
- **Verification:** Check your project folder to confirm `images/back.png`, `images/empty.png`, `images/cards/AS.png`, and `images/badges/dealer.png` exist at those exact paths (note that Linux/macOS and web servers are case-sensitive, so `AS.png` must be uppercase).

### 2. Check Which Working Directory You Run the Script From

Drafter serves static local files relative to the **current working directory** in your terminal, not necessarily the folder where the `.py` file lives.

- If your file is in `Desktop/poker/` and you run `python Desktop/poker/FINAL\ PROJECT\ DRAFT.py` from your home folder, Drafter will look for `~/images/...` instead of `~/Desktop/poker/images/...`.
- **Verification:** `cd` directly into the folder containing `FINAL PROJECT DRAFT.py` before running `python "FINAL PROJECT DRAFT.py"`.

### 3. Check if `Image` Is Imported Properly (Silent Fallback)

Lines 32–33 use `getattr(_drafter, "Image", None)`. If your version of Drafter doesn't expose `Image` at the top level—or if you are seeing bracketed text like `[A♠]` and `[??]` instead of broken image icons—`Image` is evaluating to `None` and triggering your text fallback.

- Replace lines 32–33 with a direct import so Python will tell you immediately if `Image` is missing or named differently in your version of Drafter:

```
from drafter import Image, Div, change_background_color, change_padding, change_text_align, change_border
```

- **Verification:** Run the script. If you get an `ImportError`, run `pip install --upgrade drafter` in your terminal to update to a version that supports `Image`.
```

4. Inspect the Browser Console for the Exact URL Failing

If you see broken image icons on the page, Drafter is rendering `<img>` tags, meaning the file paths are slightly off or blocked:

1. Open your browser's Developer Tools (`F12` or `Right-click -> Inspect`) and go to the **Network** or **Console** tab.
2. Refresh the poker table page and look for `404 Not Found` errors on `.png` files.
3. Compare the URL the browser requested (e.g., `http://localhost:8080/images/cards/AS.png`) against your actual folder structure.

User prompt: I have a zip folder containg all necessary contents how do I implement that

Response: To make your code load those images, extract the zip file into the exact folder structure your script expects and run Python from that directory.

1. **Locate your Python file's folder** Find the exact folder where `FINAL PROJECT DRAFT.py` is saved on your computer. *Verification:* You can see `FINAL PROJECT DRAFT.py` inside the folder window.
2. **Extract the zip archive into that same folder** Right-click your `.zip` file and choose **Extract All...** (Windows) or double-click it (Mac) to unzip its contents into the folder alongside `FINAL PROJECT DRAFT.py`. *Verification:* The extracted files are now standard folders rather than a `.zip` archive.
3. **Verify the exact folder structure** Your script uses `IMAGE_DIR = "images"` and looks for specific subfolders and uppercase card filenames. Ensure there isn't an extra wrapper folder created during extraction (such as `images/images/...` or `poker-assets/images/...`). The layout next to your `.py` file must match this tree:

   ```
   your_project_folder/
   ├── FINAL PROJECT DRAFT.py
   └── images/
       ├── back.png
       ├── empty.png
       ├── badges/
       │   ├── big_blind.png
       │   ├── dealer.png
       │   └── small_blind.png
       └── cards/
           ├── 2C.png
           ├── ...
           └── AS.png
   ```

   Verification: Opening `images/cards/` shows 52 PNG files with uppercase names (like `AS.png` and `TH.png`), and `images/badges/` contains the 3 badge PNGs.
4. **Run the script from inside that project folder** Open your terminal or IDE, navigate into `your_project_folder` (e.g., `cd path/to/your_project_folder`), and run `python "FINAL PROJECT DRAFT.py"`. If you launch it from a different working directory, Drafter will look for `images/` in the wrong place. *Verification:* Start a game in your browser—the card faces, card backs, and dealer/blind badges now appear on the green table instead of broken image icons or bracketed text.

User prompt: should I put the extracted file and the .py file in a new file together?

Response: Yes — creating a brand-new folder (directory) and putting both `FINAL PROJECT DRAFT.py` and the extracted `images` folder inside it together is the cleanest, safest way to keep everything organized and ensure Drafter finds your files.

Here is how to set up that folder cleanly:

1. **Create a new project folder** Make a new folder on your Desktop or Documents (for example, `TexasHoldemPoker`). *Verification:* You have a clean, empty folder named `TexasHoldemPoker`.
2. **Move `FINAL PROJECT DRAFT.py` into that new folder** Drag or copy `FINAL PROJECT DRAFT.py` into `TexasHoldemPoker`. *Verification:* Opening `TexasHoldemPoker` shows `FINAL PROJECT DRAFT.py` directly inside it.

3. **Move the extracted `images` folder into that same new folder** Drag the extracted `images` folder into `TexasHoldemPoker` so it sits right next to `FINAL PROJECT DRAFT.py` (do not put the `.py` file *inside* the `images` folder—they should be side by side inside `TexasHoldemPoker`). *Verification:* When you open `TexasHoldemPoker`, you see two items side by side: `FINAL PROJECT DRAFT.py` and the `images` folder (containing `back.png`, `empty.png`, `cards/`, and `badges/`).

4. **Open and run the `.py` file from that new folder** Open `TexasHoldemPoker` in your code editor (such as VS Code, Thonny, or IDLE) or `cd` into it in your terminal, then run `FINAL PROJECT DRAFT.py`. *Verification:* When you start a hand in the browser, the card images and dealer/blind badges load cleanly on the green table.
